I. GENERAL LOCATION AND DESCRIPTION

A. SITE AND MAJOR BASIN LOCATION

1. *Streets in the vicinity*

The Hollow Creek Subdivision is located at 1662 K Road in Fruita Colorado. The site is bounded on the on north by the Potter property, on the east by the Queens Subdivision, on the west by Juniper Street, and on the south by K Road (aka Ottley Ave). The Evening Breeze and Santa Fe Ranch Subdivisions are to the west across Juniper Street.

The subdivision is located in the lower part of the Big Salt Wash drainage basin. Runoff from the proposed subdivision will be detained on site and released at a metered rate.

2. *Development in the vicinity*

The site is bounded on the on north by the Potter property, on the east by the Queens Subdivision, on the west by Juniper Street, and on the south by K Road (aka Ottley Ave). The Evening Breeze and Santa Fe Ranch Subdivisions are to the west across Juniper Street.

B. SITE AND MAJOR BASIN DESCRIPTION

1. *Acreage*

The site is approximately 9.9 Acres

2. *Ground Cover*

The ground cover is in generally poor condition. The property was previously used for agricultural purposes.

3. *Hydrologic Soil Types*

The site consists of primarily Sagrlite Loam and Turley Clay Loam both of which are considered to be a Type C soils. Type C soils have low infiltration rates when thoroughly wetted and consist of soils with a layer that impedes downward movement of water. These soils are moderately fine to fine in texture.

II. EXISTING DRAINAGE CONDITIONS

A. MAJOR BASINS

1. *General topography, drainage patterns and features, canals, ditches, wetlands*

The subdivision is located in the lower part of the Big Salt Wash drainage basin. Runoff from the proposed subdivision will be detained on site and released at a metered rate.

The Big Salt Wash is northwest of the site.

2. *Previously determined 100 year flood plains*

The site is located in the 500-year floodplain (Zone X) as described on the FEMA Flood Insurance Rate Map Community Panel Number 080115 0265B (see attached). The Flood Insurance Rate Map does not indicate a base flood elevation from which to design top of footing elevations. The top of footing elevations for the homes are designed to be a minimum of 1.5 feet above the curb and gutter flow line elevation at the low corner of the individual building lots.

Review of the Final Drainage Study for the Evening Breeze Subdivision reveals that a request for a letter of map revision was made on February 12, 1999. The Federal Emergency Management Agency responded with a Letter of Map Revision dated effective May 4, 2000. The revised 100-year floodway elevation correction does not affect this site.

B. SITE

1. *Historic Drainage Patterns*

The site historically drains southeast toward K Road. Drainage was collected by a tailwater ditch. The tailwater ditch historically conveyed the flows west across Highway 50 and on to the Big Salt Wash.

2. *Inflow characteristics from up stream*

There are no apparent inflows for up stream of the existing site. The site is bounded to the north by the Potter property, on the east by the Queens Subdivision, on the west by Juniper Street, and on the south by K Road (aka Ottley Ave). The Evening Breeze and Santa Fe Ranch Subdivisions are to the west across Juniper Street.

The Potter property generally drains to the Big Salt wash. The Evening Breeze Subdivision and the Santa Fe Ranch Subdivision to the west and the Evening Breeze Subdivision to the east convey drainage away from this site.

3. *Discharge characteristics to downstream sub-basins*

The site historically drains southeast toward K Road. Drainage was collected by a tailwater ditch. The tailwater ditch historically conveyed the flows west across Highway 50 and on to the Big Salt Wash.

III. PROPOSED DRAINAGE CONDITIONS

A. CHANGES IN DRAINAGE PATTERNS

1. *Major basin*

The proposed subdivision will not significantly alter the Big Salt Wash drainage patterns.

2. *Site*

The onsite drainage patterns will be altered by directing flows from finished residential subdivision lots to the subdivision roadways. The roadways will convey storm flows to the proposed detention facility located near the intersection of Juniper Street and K Road.

Several lots along Juniper Street will drain across Juniper Street to the Santa Fe Ranch Subdivision. An existing V-pan crossing Juniper Street at near the intersection with Santa Fe Circle shall be extended to join with the proposed curb and gutter to be constructed along the east side of Juniper Street. Lots 3 through 6 of Block 3 will drain to Juniper Street flowing south to the V-pan and the west to the Santa Fe Ranch Subdivision. It is assumed that this was the intent of the original Santa Fe Ranch Subdivision design.

The remainder of the lots fronting Juniper Street will drain to the proposed curb and gutter flowing south to the intersection of Birchwood Avenue and Juniper Street. A combination curb inlet at the north east curb return will collect the flows from Juniper Street and the north curb line of Birchwood Avenue and direct them into the detention pond via a second combination curb inlet on the south curb line of Birchwood Avenue (see the Grading and Drainage Plan included).

The combination curb inlet on the south curb line of Birchwood Avenue will collect flows from Birchwood Avenue/Street. The combination curb inlets are of adequate size to capture greater than the 10-year event flows (see curb inlet calculations in the appendix). Each inlet will capture approximately 4 cfs at a depth of 0.5 feet in a sump condition. The excess flows generated by the major storm event will overtop the side walk and flow into the detention pond.

B. MAINTENANCE ISSUES

3. *Access*

Access to the detention pond will be via the intersection of Juniper Street and Birchwood Avenue. The pond is graded to slope at 6:1 near the intersection to allow for access by equipment for maintenance of the detention pond.

4. *Ownership and responsibility*

The home owners association will maintain the detention pond landscaping and the City of Fruita will maintain the inlets, pipng, outfall structure, and the connection to the 24" storm drain in K Road.

IV. DESIGN CRITERIA AND APPROACH

A. GENERAL CONSIDERATIONS

1. *Previous drainage studies performed in the area*

There have been three drainage studies performed in the area surrounding the proposed subdivision. These are the final drainage studies for the Queens Subdivision, the Santa Fe Ranch Subdivision, and the Evening Breeze Subdivision.

The Final Drainage Study for the Evening Breeze Subdivision revised February 15, 1999 by Atkins and Associates, Inc. indicates that the subdivision drains directly to the Big Salt Wash.

The Final Drainage Study for the Santa Fe Ranch Subdivision dated September 24, 2003 by this office also indicates that the subdivision drains directly to the Big Salt Wash.

The Drainage Report for the Queens Subdivision dated June 2003 by Crane Associates indicates that the subdivision drains to the Big Salt Wash via a 24" HDPE storm drain installed in K Road. Based upon the analysis performed by Crane Associates the Queens Subdivision generates a peak flow of approximately 15 cfs during the 100-year storm event. The as-built record drawings obtained from the City of Fruita indicate that the 24" storm drain was laid on a slope of approximately 0.004 ft/ft with manholes every 300 ft.

This results in a flow capacity, as defined by the City of Fruita, of approximately 17 cfs (see attached calculations). The City of Fruita defines the storm drain capacity as the depth of flow equal to the diameter of the pipeline ($d_w/\phi = 1$) allowing for no surcharging of the sewerline during the 100-year storm event.

The Preliminary Drainage Study for this site indicates that the existing Haller property generates a peak flow of approximately 7 cfs and the developed subdivision will generate peak flows of approximately 13 cfs during the 100-year storm.

The hydrologic model for the post developed drainage conditions indicates that the subdivision will generate approximately 15 cfs during the 100-year storm event and discharge flows through the proposed detention basin at a rate of approximately 5 cfs.

At the proposed detention basin outlet manhole the existing 24" stormdrain will surcharge approximately 1.7 feet above the pipeline crown under the combined 100-year storm event peak flows from the Queens Subdivision and the post-developed peak flows from the proposed Hollow Creek Subdivision.

NOTE: ESTIMATE IMPERVIOUSNESS FROM FIGURES 703, 704, 705. THEN COMPUTE CURVE NUMBER, CN, FROM EQUATION 708, BASED ON NRCS SOIL'S TYPE. USE OF THIS TABLE IS LIMITED TO EVALUATION OF IMPERVIOUSNESS FOR FUTURE DEVELOPMENT PROJECTIONS WITHIN REGIONAL WATERSHED MASTER PLANS, OR IN CONCEPTUAL DRAINAGE PLANS.

Revision	Date
ORIGINAL ISSUE	3/27/06

The soil group is determined from published soil maps for the area, which correlates each soil name with the soil group. Land use and treatment class are determined during field visits or from aerial photographs. Procedures for determining land use and treatment class are found in Chapter 8 of National Engineering Handbook, Section 4 (SCS, 1985). Antecedent moisture condition of the watershed is explained as follows:

The amount of rainfall in a period of 5 to 30 days preceding a particular storm is referred to as antecedent rainfall, and the resulting condition of the watershed in regard to potential runoff is referred to as an antecedent moisture condition. In general, higher amounts of antecedent rainfall result in greater amounts of runoff from a given storm. The effects of infiltration and evapo-transpiration during the antecedent period are also important, as they may increase or lessen the effect of antecedent rainfall. Because of the difficulties of determining antecedent storm conditions from data normally available, the conditions are reduced to three cases, AMC-I, AMC-II and AMC-III. For the Mesa County area, an AMC-II condition is recommended for determining storm runoff.

Having determined the soil group, land use and treatment class and the antecedent moisture condition, CN values can be determined from Table 704, which is reproduced from Table 2-2 in TR-55 (SCS, 1986).

When land uses shown in Table 704 are not applicable or when more detailed land use information is available, CN values can be calculated directly from imperviousness estimates using the following equation.

$$CN = 98 * Imp + X * (1 - Imp) \quad (708)$$

Where:

- Imp. = Imperviousness as a decimal
- X = Adjustment factor based on NRCS Soil Type

NRCS Soil Type	Adjustment Factor
A	39
B	61
C	74
D	80

Note that Equation 708 was derived from the data plotted on Figure 2-3 in TR-55 (SCS 1986) and applies when impervious surfaces are connected. Adjustment for disconnected impervious surfaces can be made using Figure 2-4 in TR-55. This adjustment is not required as the connected impervious surface assumption will result in conservatively high CN values.

704.3 Green and Ampt Method

The Green-Ampt method models infiltration by combining an unsaturated flow form of Darcy's law with requirements of mass conservation. The Green-Ampt method involves the simulation of rainfall loss as a two phase process. The first phase of rainfall loss is called initial abstraction (IA) or surface retention loss, which involves vegetation interception, evaporation, and surface depression storage. Typical surface retention loss values are shown in Table 705.

FEMA FLOOD INSURANCE RATE MAP

Community Panel No. 080115 0265B

LEGEND

- SPECIAL FLOOD HAZARD AREAS INUNDATED BY 100-YEAR FLOOD
- ZONE A** No base flood elevations determined.
- ZONE AE** Base flood elevations determined.
- ZONE AH** Flood depths of 1 to 3 feet (usually areas of ponding); base flood elevations determined.
- ZONE AD** Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined.
- ZONE A99** To be protected from 100-year flood by Federal flood protection system under construction; no base elevations determined.
- ZONE V** Coastal flood with velocity hazard (wave action); no base flood elevations determined.
- ZONE VE** Coastal flood with velocity hazard (wave action); base flood elevations determined.
- FLOODWAY AREAS IN ZONE AE
- OTHER FLOOD AREAS
- ZONE X** Areas of 500-year flood; areas of 100-year flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 100-year flood.
- OTHER AREAS
- ZONE X** Areas determined to be outside 500-year flood plain.
- ZONE D** Areas in which flood hazards are undetermined.
- Flood Boundary
- Floodway Boundary
- Zone D Boundary
- Boundary Dividing Special Flood Hazard Zones, and Boundary Dividing Areas of Different Coastal Base Flood Elevations Within Special Flood Hazard Zones.
- Base Flood Elevation Line; Elevation in Feet*
- Cross Section Line
- Base Flood Elevation in Feet Where Uniform Within Zone*
- Elevation Reference Mark

*Referenced to the National Geodetic-Vertical Datum of 1929

SOILS INFORMATION

Tr-Turley clay loam, 0 to 2 percent slopes

Map Unit Setting

MLRA:

Elevation: 4,500 to 4,800 feet (1,372 to 1,463 meters)

Mean annual precipitation: 7 to 10 inches (178 to 254 millimeters)

Average annual air temperature: 50 to 54 degrees F. (10 to 12 degrees C.)

Frost-free period: 150 to 190 days

Map Unit Composition

Turley and similar soils: 90 percent

Minor components: 10 percent

Component Descriptions

Turley soils

Landform: Fan terrace

Geomorphic position: Unspecified

Parent material: Alluvium derived from sandstone and shale

Slope: 0 to 2 percent

Surface fragments: Unspecified

Depth to restrictive feature: Unspecified

Drainage class: Well drained

Slowest permeability: About 0.20 in/hr (moderately slow)

Available water capacity: About 10.4 inches (high)

Shrink-swell potential: About 1.5 LEP (low)

Flooding hazard: None

Ponding hazard: Unspecified

Seasonal water table minimum depth: Greater than 6 feet

Runoff class: Medium

Calcium carbonate maximum: About 10 percent

<http://mcgis.co.mesa.co.us/soils/osd/Tr.htm>

4/3/2006

Gypsum maximum: None

Salinity maximum: About 2 mmhos/cm (nonsaline)

Sodicity maximum: About 0 SAR (nonsodic)

Ecological site: Unspecified

Potential native vegetation: Unspecified

Land capability (irrigated): 2e

Land capability (non irrigated): 7c

##

Typical Profile:

Ap-0 to 10 inches; clay loam

C1-10 to 20 inches; fine sandy loam

C2-20 to 30 inches; clay loam

C3-30 to 60 inches; stratified loam to silty clay loam

##

Minor Components

Other Soils and similar soils

Composition: About 10 percent

Landform: Unspecified

Geomorphic Position: Unspecified

Slope: Unspecified

Depth to restrictive feature: Unspecified

Drainage class: Unspecified

Ecological site: Unspecified

##

Re-Sagrlite loam, 0 to 2 percent slopes

Map Unit Setting

MLRA:

Elevation: 4,500 to 4,900 feet (1,372 to 1,494 meters)

Mean annual precipitation: 7 to 10 inches (178 to 254 millimeters)

Average annual air temperature: 50 to 54 degrees F. (10 to 12 degrees C.)

Frost-free period: 150 to 190 days

Map Unit Composition

Sagrlite and similar soils: 90 percent

Minor components: 10 percent

Component Descriptions

Sagrlite soils

Landform: Terrace, alluvial fan

Geomorphic position: Unspecified

Parent material: Silty alluvium derived from sandstone and shale

Slope: 0 to 2 percent

Surface fragments: Unspecified

Depth to restrictive feature: Unspecified

Drainage class: Well drained

Slowest permeability: About 0.60 in/hr (moderate)

Available water capacity: About 9.3 inches (high)

Shrink-swell potential: About 1.5 LEP (low)

Flooding hazard: None

Ponding hazard: Unspecified

Seasonal water table minimum depth: Greater than 6 feet

Runoff class: Low

Calcium carbonate maximum: About 20 percent

<http://mcgis.co.mesa.co.us/soils/osd/Re.htm>

4/3/2006

Gypsum maximum: About 1 percent

Salinity maximum: About 8 mmhos/cm (slightly saline)

Sodicity maximum: About 10 SAR (slightly sodic)

Ecological site: Unspecified

Potential native vegetation: Unspecified

Land capability (irrigated): 2s

Land capability (non irrigated): 7c

##

Typical Profile:

Ap-0 to 13 inches; loam

C-13 to 60 inches; silt loam

##

Minor Components

Other Soils and similar soils

Composition: About 10 percent

Landform: Unspecified

Geomorphic Position: Unspecified

Slope: Unspecified

Depth to restrictive feature: Unspecified

Drainage class: Unspecified

Ecological site: Unspecified

TYPE 'B' TYPICAL LOT GRADING

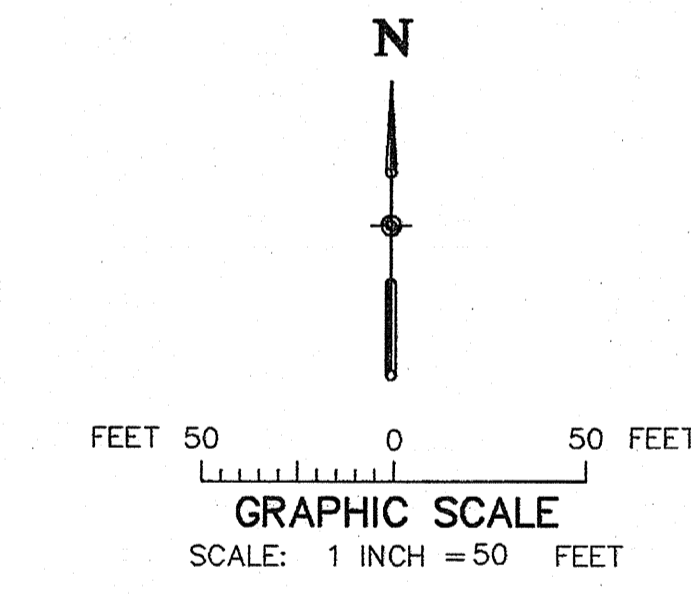

TYPE 'A' TYPICAL LOT GRADING

NOTES:
 ALL LOTS ARE TYPE 'A' UNLESS MARKED OTHERWISE ON PLAN.
 MINIMUM ELEVATION OF TC (TOP OF SLAB OR FOUNDATION) SHALL BE 0.67 FT. + 2% OF SETBACK (25') = 1.17' ABOVE (MEASURED FROM FLOWLINE OF GUTTER).
 MINIMUM SIDE AND REAR SLOPES SHALL BE 6" DROP FROM FOUNDATION IN FIRST 10'.

T.C. = TOP OF CONCRETE (MINIMUM ELEVATION) NOT TO SCALE
