FINAL DRAINAGE REPORT

WILDWOOD ACRES SUBDIVISION

I. LOCATION AND DESCRIPTION OF PROPERTY

PROPERTY LOCATION

Wildwood Acres Subdivision contains approximately 46.36 acres and is located in the City of Fruita, Colorado, between 17 ½ and 18 Roads and south of K 6/10 Road. The project proposes a total of 122 single family lots with Filing 1 consisting of 14 lots (including a lot encompassing the petitioner's home along 18 Road). It is currently the intention to develop the site in 6 Filings of approximately 20 lots each. The site is currently zoned "Community Residential" as is all surrounding property. The cover sheet of the final plans shows the location of the property in relationship to the surrounding vicinity. The project currently consists of two parcels. Tax Parcel numbers for the subject properties are 2697-084-00-095 and 2697-084-00-096.

Existing streets in the vicinity include 18 Road to the east, 17 ½ Road to the west, and K 6/10 Road to the north. A system of urban residential streets is proposed to run through the project providing access and utility corridors in two directions. These streets will create a connection between two designated collectors (17 ½ Road and 18 Road) through existing Wildwood Estates and Hall Minor Subdivisions. A walking trail and pedestrian bridge is anticipated to be constructed by the City (during future filings) below the banks of the Little Salt Wash and for connection to Little Salt Wash Park (a 23 acre community park currently under development by the City of Fruita on the property adjacent to the southeast border of the site). The surrounding land uses in the vicinity include single family dwellings on subdivided tracts and scattered undeveloped residential/rural lands on larger tracts.

DESCRIPTION OF PROPERTY

The site currently contains a residential structure in the southeast corner along 18 Road and is generally being used agriculturally as a small farm containing hay and livestock pasture. A drain ditch (The Denton Drain) borders the property on the north. The Little Salt Wash borders the property on the south. Runoff from the east is diverted by the residential development (Hall Minor Subdivision) currently under construction and by the pavement crown of 18 Road. Topography of the property is relatively "flat" in nature, sloping to the southwest at an average rate of less than one percent. This proposal calls for the ultimate future development of 122 dwelling units with a finished density of 2.65 units per acre.

Based on the "Soil Survey, Grand Junction Area" (by the USDA Soil Conservation Service Series 1940, No. 19), the on-site soils are described as mainly Ravola fine sandy loam(Rc) and Ravola clay loam (Ra) with smaller areas of Billings silty clay loam (Bc) and Fruita very fine sandy loam

(Fp) on 0-2% slopes. These soils are defined mainly within the hydrological soils group "B" having a moderate infiltration rate and relatively low runoff potential.

II. EXISTING DRAINAGE CONDITIONS

MAJOR BASIN

Wildwood Acres is located within the Little Salt Wash Drainage Basin which consists of approximately 60 square miles situated between the other major basins of Adobe Creek and Big Salt Wash. Headwaters for this basin begin in Hunter Canyon on the south face of the Bookcliffs and eventually drain to the Colorado River at approximately 17 ½ Road after passing through the northern and western portions of the current City Limits. A map of this basin is included in the appendix.

No proposed residential lots within Wildwood Acres exist within the 100 year floodplain as delineated by the July 15, 1992 Flood Insurance Rate Maps produced by FEMA (partial copy enclosed in the Appendix). These lots are also outside of the Zone "X" area of the 500 year flood. This was determined by a comparison of the flood contours provided in the FEMA mapping with the ground contours established during topographic mapping of the site during the design phase of this project. After adjustment of vertical datums for both sources, it can be seen that the 100 year flood level is well below the north top-of-bank. This top-of-bank was defined during the data collection for the topo survey and used to establish the southern property boundary for the lots along the wash. The area between this lot-line and the center of the wash is a tract of ground which will be dedicated to the City of Fruita for use as a conservation easement and pathway for pedestrian access along the northern bank.

SITE

Currently, the property is in an agricultural utilization and drains in a sheetflow fashion from east to west at an average slope of approximately 0.8 percent. Runoff and irrigation tailwater from the site is collected by surface ditches existing along the west and south boundaries. These ditches carry on-site runoff to the southwest corner of the site where they then drain directly into the Little Salt Wash.

OFF-SITE IMPACTS TO THE SITE

Because of the elevated roadway surface of 18 Road to the east and the large open drain ditch (Denton Drain) along the north, no offsite impacts are created for the site by areas north or east of these boundaries.

III. PROPOSED DRAINAGE CONDITIONS

CHANGES IN DRAINAGE PATTERNS

No substantial change in the released drainage pattern is proposed for the site. Drainage patterns within the site will be modified to accommodate development and to better control surface flows to designated collection areas. The developed site will consist of three main basins discharging to the south directly into the Little Salt Wash. Un-detained flows will follow the same path as they do now, traveling southwest into the Colorado River. Two of the three developed basins are divided into several sub-basins to determine flows to the proposed storm inlets. These calculated flows are shown in the appendix. The main storm sewer along Hall Street (the westernmost street) is necessary to carry developed flows south to the wash to reduce accumulated flows on the roadway surface and comply with stormwater criteria for maximum allowable half-street flows. This street parallels existing contours and would have been difficult to grade entirely to the south. A series of low points was, therefore, designed along the roadway to provide inlets for the storm sewer and eliminate street accumulation. Overall, the roadway is sloped slightly to the south to provide an emergency release route for surface drainage should the proposed storm sewer fail. The drain pipe is, however, designed to carry the 100 year runoff below the surface of the street.

Detailed design information is only included for storm sewers within filing one for this report. Runoff directions and quantities, however, are calculated and included for all future filings and shown on the stormwater management plan included in the appendix. Discussions with the Grand Junction Drainage District indicate a desire to divert a portion of the existing flows from the Denton Drain (near it's 90 degree turn to the west) southward through the development and into the Little Salt Wash. This could be accomplished by routing a diversion pipeline along the rear or side property lines (in established easements) and roadways of a future filing almost directly south to the wash while utilizing the same pipeline for discharge of the developed runoff for that particular area. Again, the details of this agreement and pipe sizing should be provided in the design process for that particular future filing.

OFFSITE IMPACTS FROM THE SITE

Runoff impacts from this site to downstream properties should not be adverse given the stormwater management concept proposed. Site runoff will be intercepted and prevented from sheet flowing off the site to the west by proposed streets, storm sewers, and elevated building site areas along the western boundary. Direct-discharge is recommended by the Stormwater Management Master Plan for the City of Fruita (June, 1998) for developments discharging to the Little Salt Wash. This project is in accordance with this recommendation which was developed to discharge surface runoff from sites located within the lower portions of the major basin prior to arrival of larger flows developed upstream in the majority of the watershed.

MAINTENANCE

Access to the stormwater management facility will be by existing streets and platted tracts and easements as required. The home owners will provide maintenance responsibility for the surface improvements related to the facility. Operation and maintenance of the underground storm sewers will be the responsibility of the City of Fruita.

IV. DRAINAGE DESIGN CRITERIA AND APPROACH

REGULATIONS

The City of Grand Junction and Mesa County Stormwater Management (SWM) Manual (May 1996) was used as the basis for analysis and facility design criteria. Also utilized was information from the Stormwater Management Master Plan (June, 1998) written for the City of Fruita. Surrounding developments have been approved and constructed within the guidelines of the SWM manual, as will this development, to assure minimal impacts to the downstream properties. Haestad Methods software ("Pondpack" and "Flowmaster") was used to perform the calculations. Copies of all calculations discussed below are included in the appendix of this final report.

HYDROLOGICAL CRITERIA

Because the project is a residential development consisting of several basins ranging in size from less than one acre to approximately five acres, the "Rational Method" was used to calculate the historic and developed flow rates. As required by the "Stormwater Management (SWM) Manual", the minor storm event is considered to be the 2 year frequency storm and the major storm event is considered to be the 100 year frequency event. Historic runoff was determined for the existing 40 acre site (excluding direct runoff from the north bank of the wash comprising approximately 6 acres) and compared with developed peak flows which were calculated for each individual storm inlet basin and collectively for the 3 main developed basins.

Runoff Coefficients and intensity-duration-frequency data used in the computations were based on the most recent SWM Manual criteria defined above. Coefficients were assigned based on land use and existing hydrological soils groups.

HYDRAULIC CRITERIA

All site facilities and conveyance elements (including streets and inlets) were designed in accordance with the City of Grand Junction SWM Manual and the City of Fruita Design Standards and Construction Specifications. Peak flows were analyzed for both sides of the street and corresponding inlets to insure adequate capacity at all design points.

Open channels and pipelines were analyzed using Manning's Equation and roughness coefficients found in the SWM Manual. The storm sewer pipeline along Hall Street to the Little Salt Wash was sized to carry un-detained flows (direct discharge) of the 100 year peak.

V. RESULTS AND CONCLUSIONS

AREAS

Site - 40.5 Acres (EXCLUDING 6 ACRES NEAR BANK)

- Basin 1-A - 1.55 Acres
- Basin 1-B - 3.18 Acres
- Basin 1-C - 2.67 Acres
- Basin 1-D - 0.33 Acres
- Basin 1-E - 0.55 Acres
- Basin 1-F - 3.69 Acres
- Basin 1-G - 1.77 Acres
- Basin 1-H - 0.55 Acres
- Basin 1-I - 4.28 Acres
- Basin 1-J - 4.82 Acres
- Basin 1 (TOTAL) 23.39 Acres

Basin 2-A - 2.82 Acres (TOTAL - SINGLE BASIN)

- Basin 3-A - 0.78 Acres
- Basin 3-B - 3.87 Acres
- Basin 3-C - 1.03 Acres
- Basin 3-D - 2.95 Acres
- Basin 3-E - 4.53 Acres
- Basin 3 (TOTAL) 13.16 Acres

<u>Basin 3-E</u>	<u>1.21</u>	<u>6.09</u>
Basin 3 (indep.)	3.30	16.69

CONCLUSION

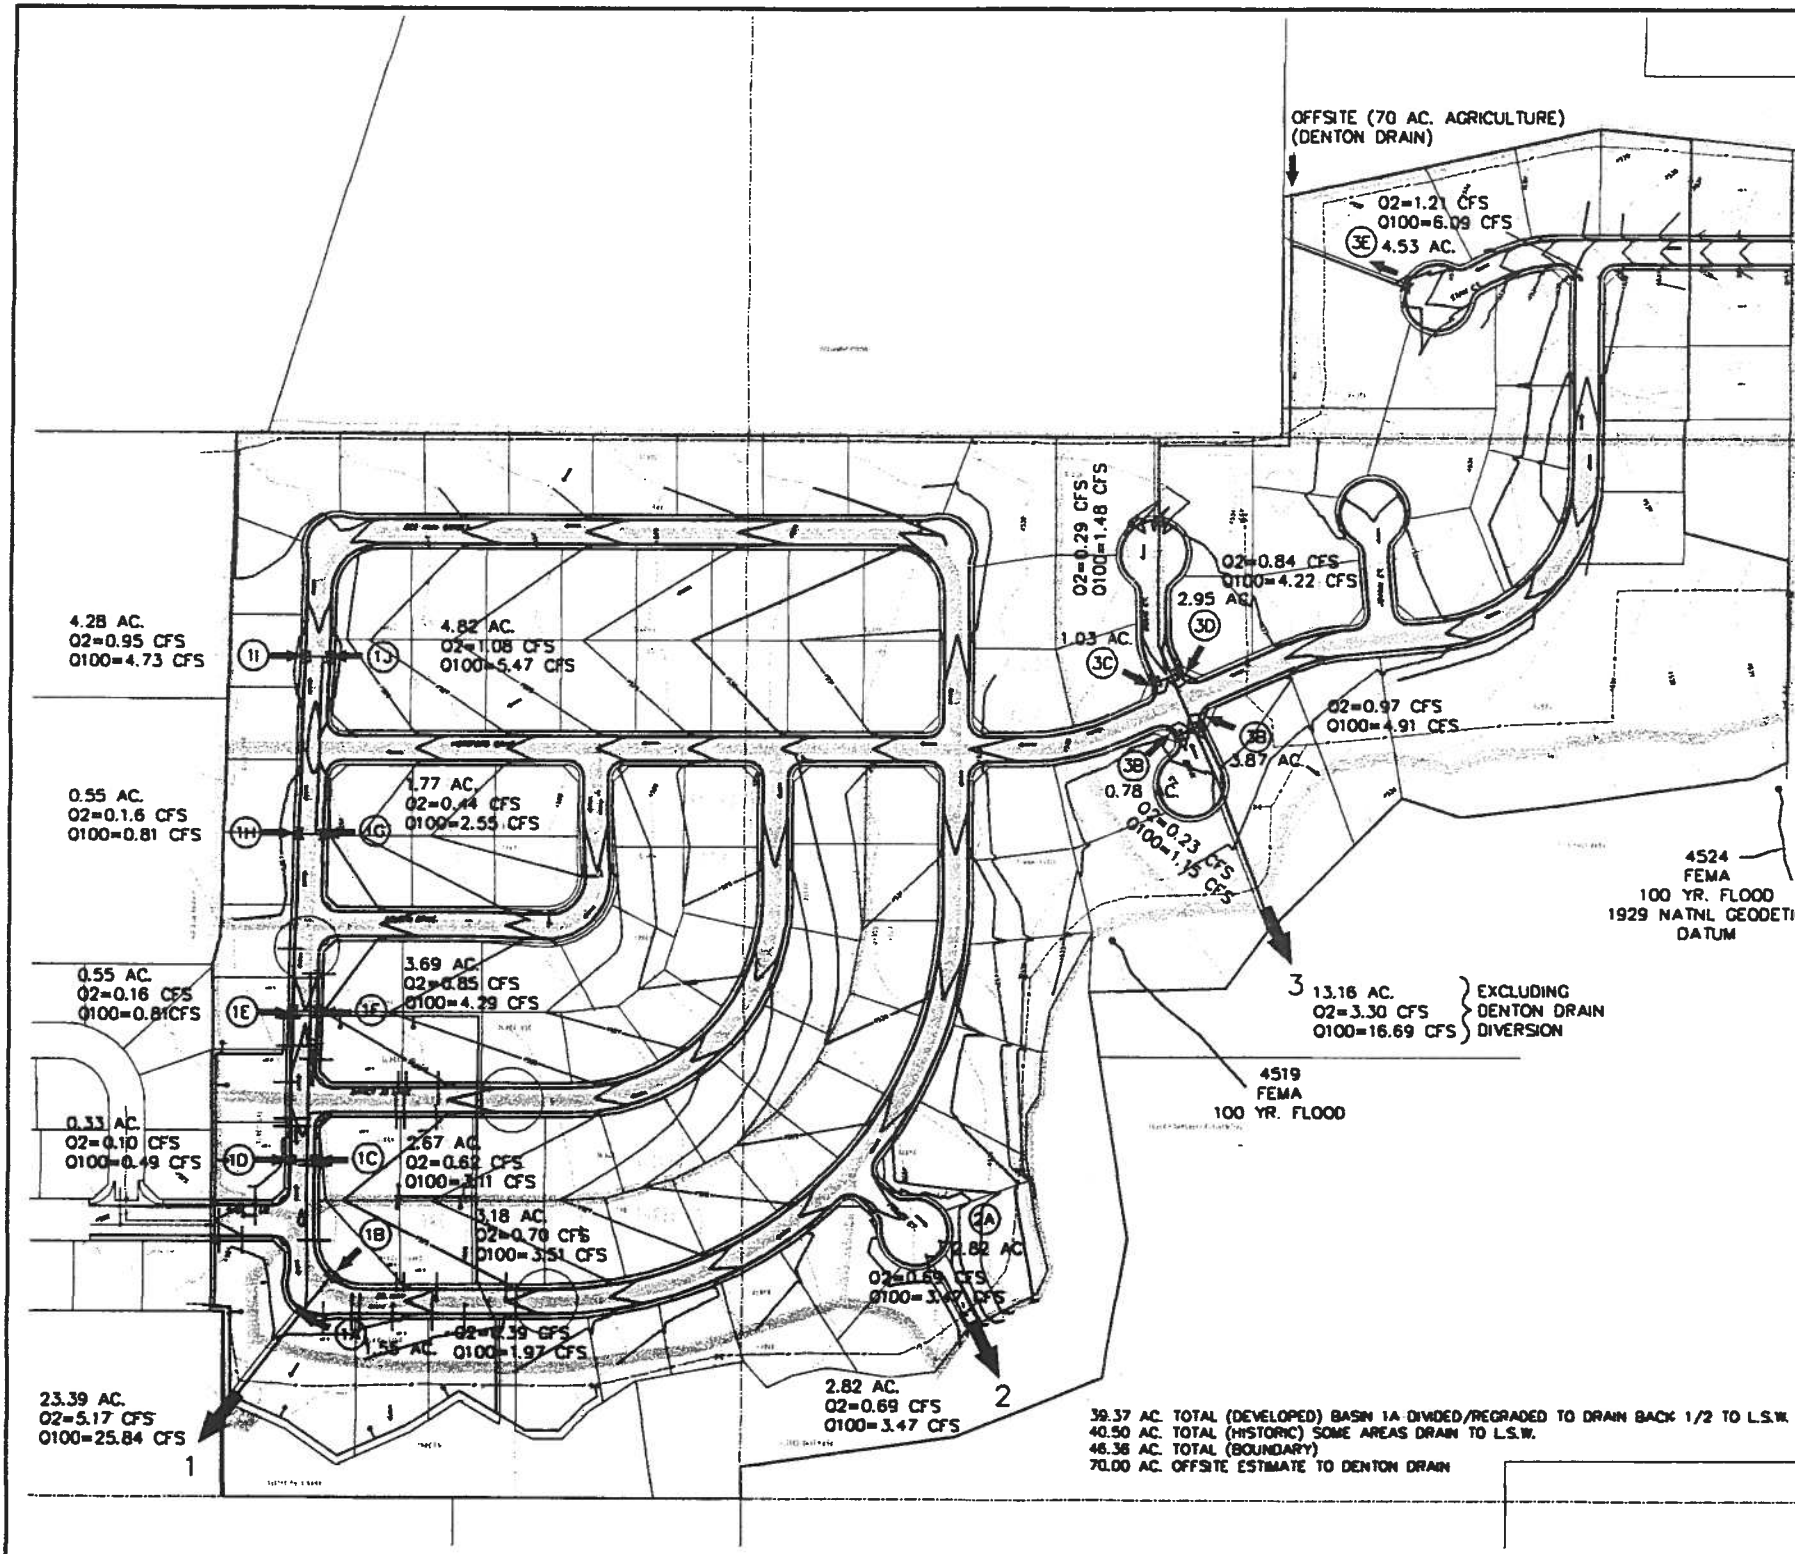

The developed site will discharge runoff directly to the Little Salt Wash in accordance with recommendations of the City's SWMP. This stormwater management plan is therefore in conformance with criteria established by the City.

Cemeteries, playgrounds	20-30 24-34	26-36 32-42	35-45 40-50	40-48 47-55	35-45 40-50	38-46 44-52	40-48 47-55	46-54 54-62	30-38 36-44	38-44 45-53	38-44 45-53	40-48 50-58	34-42 40-48	40-48 50-58	50-58 60-68

NOTES: 1. Values above and below pertain to the 2-year and 100-year storms, respectively.
 2. The range of values provided allows for engineering judgement of site conditions such as basic shape, homogeneity of surface type, surface depression storage, and storm duration. In general, during shorter duration storms ($T_c \leq 10$ minutes), infiltration capacity is higher, allowing use of a "C" value in the low range. Conversely, for longer duration storms ($T_c > 30$ minutes), use a "C" value in the higher range.
 3. For residential development at less than 1/8 acre per unit or greater than 1 acre per unit, and also for commercial and industrial areas, use values under MISC SURFACES to estimate "C" value ranges for use.

RATIONAL METHOD RUNOFF COEFFICIENTS
 (Modified from Table 4, UC-Davis, which appears to be a modification of work done by Rawls)

SECTION 5
HYDRAULICS

MAXIMUM HALF STREET FLOWS ($S_x=2\%$, $n=0.016$)
 (Based upon Figures G-3 and G-4)

FIGURE "G-5"

ROAD TYPE	COMBINATION INLET CAPACITY (CFS)					
	SINGLE		DOUBLE		TRIPLE	
	2-YR	100-YR	2-YR	100-YR	2-YR	100-YR
Urban Residential (local)	6.4	13	9.5	22	12.7	31
Residential Collector, Commercial and Industrial Streets	3.2	13	4.9	22	6.5	31
Collector Streets (3000 - 8000 ADT)	2.7	13	4.0	22	5.3	31
Principal and Minor Arterials	6.0	13	9.0	22	12.0	31
<p>Inlet capacities shown above are based upon: 1) use of non-curved vane grates (similar to HEC-12 P-1 7/8-4 grates; 2) HEC-12 procedures; 3) clogging factors per Section VI; and 4) City/County standard inlets with 2-inch radius on curb face and type C grates. Capacities shown for 2-year storms are based upon depths allowed by maximum street inundation per Figure "G-3". The 100-year capacities are based upon a ponded depth of 1.0 foot. Note that only combination inlets are allowed in sag or sump conditions.</p>						
MAXIMUM INLET CAPACITIES: SUMP OR SAG CONDITION				TABLE "G-1"		

INLET CAPACITIES PROVIDED ARE BASED UPON FIGURE "G-4", MAXIMUM ALLOWED FLOW CONDITIONS, SMF ENGINEERING CORP.'S HEC-12 SOFTWARE, CLOGGING FACTORS PRESENTED IN SECTION VI, AND CITY/COUNTY STANDARD INLETS.

MAXIMUM INLET CAPACITIES: ON-GRADE
URBAN RESIDENTIAL (LOCAL)
